

## **TASK PLAN**

### **Library Management System**

The library management system is a software to manage the manual functions of a library. The software helps to manage the entire library operations from maintaining book records to issue a book. In addition, it allows streamlined management of fine details of books such as author name, edition, and many other important details. So, it is easier to search for books and find the right materials for students and the librarian.

Electronic management via the software is essential to track information like issue date, due date, who has borrowed any material, etc. The system is developed and designed with an aim to facilitate efficient management of the schools to manage a modern library with accurate data management.

#### **Components of a Library Management System**

In order to maintain library management software, you will have the following set of components. These components are efficient to manage library operations accurately.

**Admin:** the administrators can access the entire functionality of the system via this component. The admin can maintain the records and track them as necessary. Also, the admin can add or remove entries into the system respectively.

**Reader:** the students who want to access library materials must do registration first. The registration allows for maintaining records accurately. After registering, they can check out and check in the library material.

**Book:** The admin can add new books or other materials to the system with the essential details. Each book has authno, isbn number, title, edition, category, PublisherID and price.

**Publisher:** The publisher has PublisherId, Year of publication and name.

**Report:** It has UserId, Reg\_no, Book\_no and Issue/Return date. Admin can view the issued materials with their due date. And, if any book is overdue, the system will allow calculating fine for the same.

#### **Relation**

- Book(authno, isbn number, title, edition, category, PublisherID, price)
- Reader(UserId, Email, address, phone no, name)
- Publisher(PublisherId, Year of publication, name)
- Report( UserId, Reg\_no, Book\_no, Issue/Return date)
- Admin (LoginId, password)

#### **TASK 1: Conceptual Design through FTR**

**CO1, S3**

(Tool: Creately/ERD Plus ,ALM:Think pair share)

Using basic database design methodology and ER modeler, design Entity Relationship

Diagram by satisfying the following sub tasks:

1. a Identifying the entities.
1. b Identifying the attributes.

#### **Sample Output**

- Publisher(PublisherId, Year of publication, name)
  - Admin(LoginId, password, name, staff\_id)
  - Report( UserId, Reg\_no, Book\_no, Issue/Return date)
  - Book(authno, isbn number, title, edition, category, PublisherID, price)
    - Name is composite attribute of firstname and lastname.
    - Phone no is multi valued attribute.
  - Reader(UserId, Email, address, phone no, name)
- c Identification of relationships, cardinality, type of relationship.

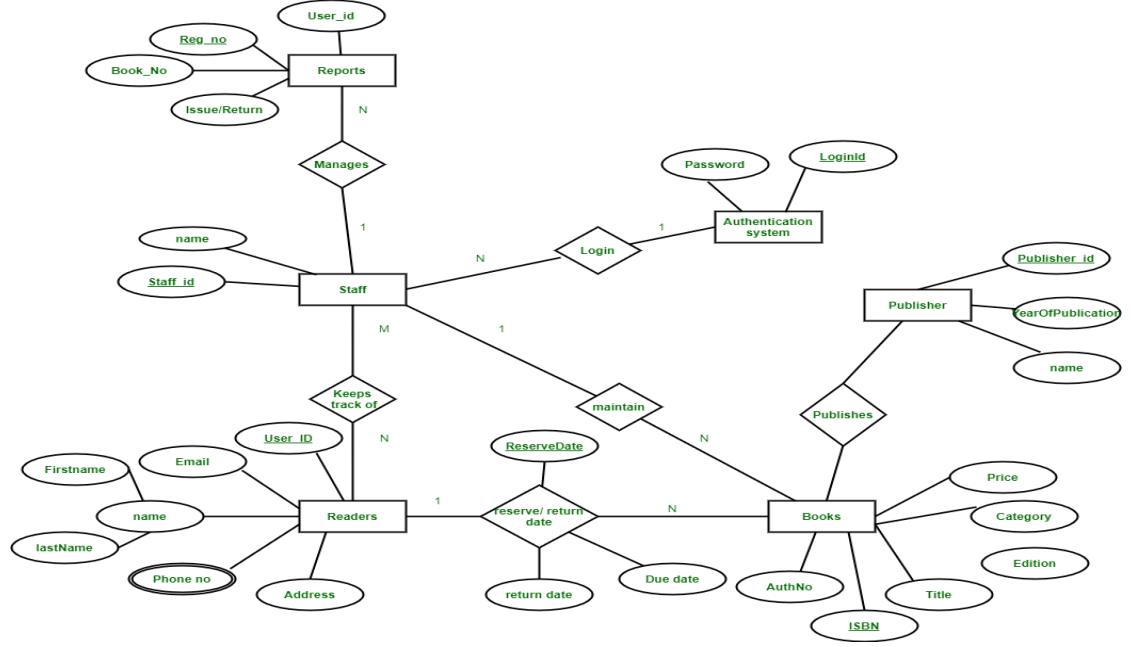

#### **Sample Output**

- A reader can reserve N books but one book can be reserved by only one reader. The relationship 1:N.
- A publisher can publish many books but a book is published by only one publisher. The relationship 1:N.
- Admin keeps track of readers. The relationship is M:N.
- Admin maintains multiple reports. The relationship 1:N.
- Admin maintains multiple Books. The relationship 1:N.
- Admin provides login to multiple staffs. The relation is 1:N.
- d Reframing the relations with keys and constraint.

#### **Sample Output**

- {isbn number} is the Primary Key for Book Entity.
- {authno, isbn number, title} – Super key of Book entity.
- {PublisherId} is the foreign key of Book entity.
- {authno,title} – Candidate key of Book entity.
- UserId is the Primary Key for Readers entity.
- PublisherID is the Primary Key for Publisher entity
- LoginID as Primary Key for Authentication system entity.
- Reg\_no is the Primary Key of reports entity.

1. e Using creatively, develop ER diagram.

## TASK 2: Generating design of other traditional database model CO1, S3

(Tool: Creately, ALM:Mind map)

Creating Hierarchical /Network model of the database by enhancing the sound abstract data by performing following tasks using forms of inheritance:

2. a Identify the specificity of each relationship, find and form surplus relations.
- 2.b Check is-a hierarchy/ has-a hierarchy and performs generalization and/or specialization relationship.
2. c Find the domain of the attribute and perform check constraint to the applicable.
2. d Rename the relations.
2. e Perform SQL Relations using DDL, DCL commands.
  - Create all relations using DDL comments
  - Alter the table Reader by adding email\_id as a field.

### Sample output

Syntax: Alter table reader add email\_id varchar(20);

Output: Table altered

- Retrieve all the books under the category dbms.
- COMMIT the table after inserting values
- Rollback the table.

## TASK 3:Using Clauses, Operators and Functions in queries: CO2, S3

(Tool: SQL/ Oracle, ALM:Fish bowl)

Perform the query processing on databases for different retrieval results of queries using DML, DRL operations using aggregate, date, string, indent functions, set clauses and operators.

- Retrieve all the author who wrote in dbms.
- Retrieve total number of books offered in the category program core

- Retrieve all authno and name who published books after 2000
- Retrieve readers name end with letter ‘a’
- Retrieve number of readers studied in each department.

**Sample Output:**

ECE        800

CSE        850

EEE        1000

- Retrieve all the female readers
- Retrieve all the staff who came library yesterday.

**TASK 4: Writing Sub Queries and Join Queries:**

**CO2, S3**

(Tool: SQL/ Oracle, ALM: Fish bowl)

Perform the advanced query processing and test its heuristics using designing of optimal correlated and nested sub queries such as finding summary statistics.

- Retrieve isbnnumber ,authnumber and title of the books published under the course DBMS
- Retrieve reader name,id,dept id,department who studied in department CSE .
- Retrieve number of staff borrowed from each category of course
- Retrieve publisher id, year, name of the book published under the course OS.
- Retrive all the author name who are all published more than 30 books in the year 2022.
- Retrieve all the male readers name and their emailid

**Sample input:**

<refer reader, emailid>

**Sample output:**

name                  emailid

Rahul                  [jeni@gmail.com](mailto:jeni@gmail.com)

**TASK 5: Design Datalog query and recursive queries(Tool: SQL/ Oracle)**

**CO2, S2**

Make use of Datalog query designing and recursive query for student registered for a course.

Find the prerequisite of object-oriented software engineering using recursive query

**Sample input:**

WITH RECURSIVE

Coursename(pre1, pre2) AS

(

(SELECT cname, pre-sub FROM pre\_requisites)

UNION

(SELECT a1.pre1, a2.pre2

FROM coursename a1, Ancestor a2

WHERE a1.pre2 = a2.pre1)

)

SELECT pre1

FROM Ancestor

WHERE pre2= 'OOSE';

**Sample output:**

PROBLEM SOLVING USING C

**TASK 6: Procedures, Function and Loops:****CO3, S3**

(Tool: SQL/ Oracle)

Programming using PL/SQL Procedures, Functions and loops on Number theory and business scenarios like.

- Write PL/SQL procedure using while loop, printing prime numbers in a range given.
- Write PL/SQL function recursion for factorial finding and calculate nth term.
- Write PL/SQL block without procedure/function to print all even multiples of 4,8 and not of 32 below 500.
- Write a non-recursive procedure for palindrome checking.

**Sample input:**

Enter input: madam

**Sample output:**

Madam is Palindrome

- Write a simple loop program to print 1 2 3 vertically using PL/SQL loop

**TASK 7: Triggers, Views and Exceptions** (Tool: SQL/ Oracle)**CO3, S3**

Conduct events, views, exceptions on CRUD operations for restricting phenomenon

- Create a simple trigger before insert or update or delete trigger in student table

**Sample input:**

&lt;refer user schema&gt;

**Sample output:**

S\_id is inserted successfully

- Create a view of all readers name and emaiid who are currently in fourth semester.

**Sample input:**

&lt;refer reader schema&gt;

```
create trigger book_copies_deducts
after INSERT
on book_issue
for each row
update book_det set copies = copies - 1 where bid =
new.bid;
```

**Sample output:**

```

mysql> insert into book_issue values(1, 100, "Java");
Query OK, 1 row affected (0.09 sec)

mysql> select * from book_det;
+----+-----+-----+
| bid | btitle      | copies |
+----+-----+-----+
|   1 | Java        |      9 |
|   2 | C++         |      5 |
|   3 | MySql        |     10 |
|   4 | Oracle DBMS |      5 |
+----+-----+-----+
4 rows in set (0.00 sec)

```

- Raise an exceptional handling whenever a user tries to identify publisherid that does not exists from Publisher Table.

**TASK 8: CRUD operations in Document databases** (Tool: MongoDB )  
CO3, S3

Perform Mongoose using NPM design on MongoDB designing document database and performing CRUD operations like creating, inserting, querying, finding, removing operations.

Perform the following tasks of library databases.

- Design mongoDB collection for students
- Insert single student detail at a time

**Sample input/output:**

- Db.student.insertOne({s\_id:VTU12345”,Name:”Stephen”,year:”3”,dept\_id:”101”,contact no,”9876543210” },
- 1 document inserted
- Db.book.find().pretty();
- Insert multiple students at a time
- Insert all at a time.
- Find students who enrolled Java
- Find coursename which is registered by most number of students
- Delete single student record at a time
- Delete multiple student at a time
- Delete all student at a time who are all registered more than
- Update Faculty at a time who is taken single course
- Update multiple faculty at a time who are all handled compiler design
- Update all faculty at a time

**TASK 9: CRUD operations in Graph databases** (Tool:Neo4j)  
CO3, S3

Perform GraphQL/Neo4j graph space design for recommendation engines. Also perform CRUD operations like creating, inserting, querying, finding, deleting operations on graph spaces.

- Create a graph database for different categories of courses offered by the

department and their pre-requisites

- Create a node for prerequisites

**Sample input:**

Create (pr: pre-requisites

```
{ ccode:123, cname:"DBMS",pre_id:"12345",pre_sub: "DS"
```

```
}
```

```
)
```

- Insert a course details in each course category
- Delete a course enrolled by student if not satisfied the prerequisites

**TASK 10: Normalizing databases using functional dependencies upto BCNF**

**CO1, S2**

(Tool: GU/ Table Normalization Tool, ALM:Learning by doing)

Upon relational tables created in task-2, perform normalization up to BCNF based on given Dependencies as following for the assumed relations specified:

**Sample input**

- Book(authno, isbn number, title, edition, category, PublisherID, price)
- Reader(UserId, Email, address, phone no, name)
- Publisher(PublisherId, Year of publication, name)
- Admin(LoginId, password, name, staff id)
- Report( UserId, Reg\_no, Book\_no, Issue/Return date)

Isbn number authno,title,publisher id

Isbn number edition,category

Isbn number authno

useridname,contactno,

userid name

PublisherId coursename,credits,category

LoginId name, staff\_id

LoginId staff\_id

**3. a** Apply the functional dependency, normalize to 1NF

**3. b** Normalize the relations using FD+ and  $\alpha+$

**3. c** Find the minimal cover, canonical cover.

**3. d** Normalize to 2NF, add/alter constraints if necessary.

**3. e** Normalize to BCNF, add/alter constraints if necessary.

**3. f** Normalize to 3NF, add/alter constraints if necessary.

**3. g** Perform SQL Relational operations using simple DML queries.

**Sample output**

## TASK 11: Menus, Forms and Reports: CO4, S3

(Tool: SQL/ Oracle 11g ,ALM:Pick the winner)

For an application, creating and debugging Menus, Forms and reports using Oracle Forms and Report Builder, make a report of students with their details.

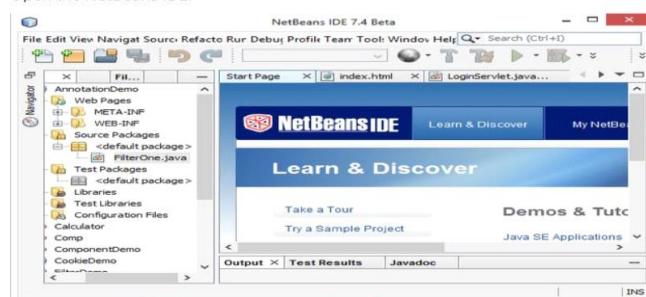

### Sample input:

Make a report of students with their details

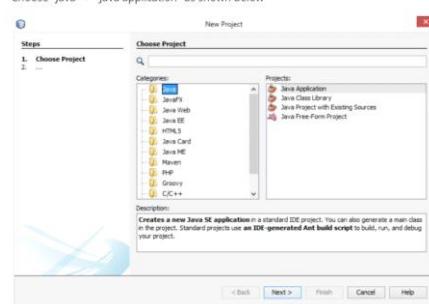

### Sample output:

s_id	s_name	year	dept_id	dob	gender	place
1234	TEJA	3	301	17/08/2001	M	Chennai
9876543210	<a href="mailto:xyz@gmail.com">xyz@gmail.com</a>					

Open the NetBeans IDE.

Choose "Java" -> "Java Application" as shown below

 Enter Details

---

Book ID(BID)	3
User ID(UID)	2
Period(days)	10
Issued Date(DD-MM-YYYY)	02-09-2019

**Submit**

### **TASK 12: Micro Project**

**CO5, S3**

(Tool: Oracle SQL/ SQL Developer/MySQL/MongoDB/NetBeans)

Develop Micro project based on business case scenario on use cases specified in Part-II.

#### **Part-II**

\*\*In perusal to the above task, Every student shall select and incorporate for one of the following use cases for Task-12.

##### **Use case-1: User Module.**

This module is further divided into various sub-modules describing the user in a better way:

- **New user register:**
  - To sign up a new user to this system.
- **Student Login:**
  - So as to confirm that only an authenticated user is using the project.
- **Search book:**
  - The user can search book based on book id, book name, or by author name.
- **Issue Book:**
  - To help the user get the required books issued.
- **Return Book:**
  - To return the book before the last date without fine, or after the specified time duration with a late fine.

##### **Use case-2: Admin Module**

It is to be operated by the admin with a unique id and password. The admin is the person who decides authentication and authorization for all the different users of the application.

**It further can be subdivided as:**

- Register user.
- Issue Book.
- Maintain books in a stack, which means record the availability at a regular time interval.

### **Use case-3: Librarian Module**

Includes all the library staff who are required to enter the records in the system and keep an eye on the various activities like the issue of the book, the return of the book, non-availability of books, etc. through the developed system.

## **TASK 1 - CONCEPTUAL DESIGN THROUGH FTR**

### **Aim**

To identify entities attributes and relationship from the usecase given and to draw the ERDiagram for the same.

### **Tasks and sample output**

Using basic database design methodology and ER modeler, design Entity Relationship

Diagram of library management system.

#### **1. a. Identifying the entities.**

#### **1. b. Identifying the attributes.**

##### **Sample Output**

- Publisher(PublisherId, Year of publication, name)
- Admin(LoginId, password, name, staff id)
- Report( UserId, Reg\_no, Book\_no, Issue/Return date)
- Book(authno, isbn number, title, edition, category, PublisherID, price)
  - Name is composite attribute of firstname and lastname.
  - Phone no is multi valued attribute.
- Reader(UserId, Email, address, phone no, name)

#### **2. Identification of relationships, cardinality and type of relationship.**

##### **Sample Output**

- A reader can reserve N books but one book can be reserved by only one reader. The relationship 1:N.
- A publisher can publish many books but a book is published by only one publisher. The relationship 1:N.
- Admin keeps track of readers. The relationship is M:N.
- Admin maintains multiple reports. The relationship 1:N.
- Admin maintains multiple Books. The relationship 1:N.

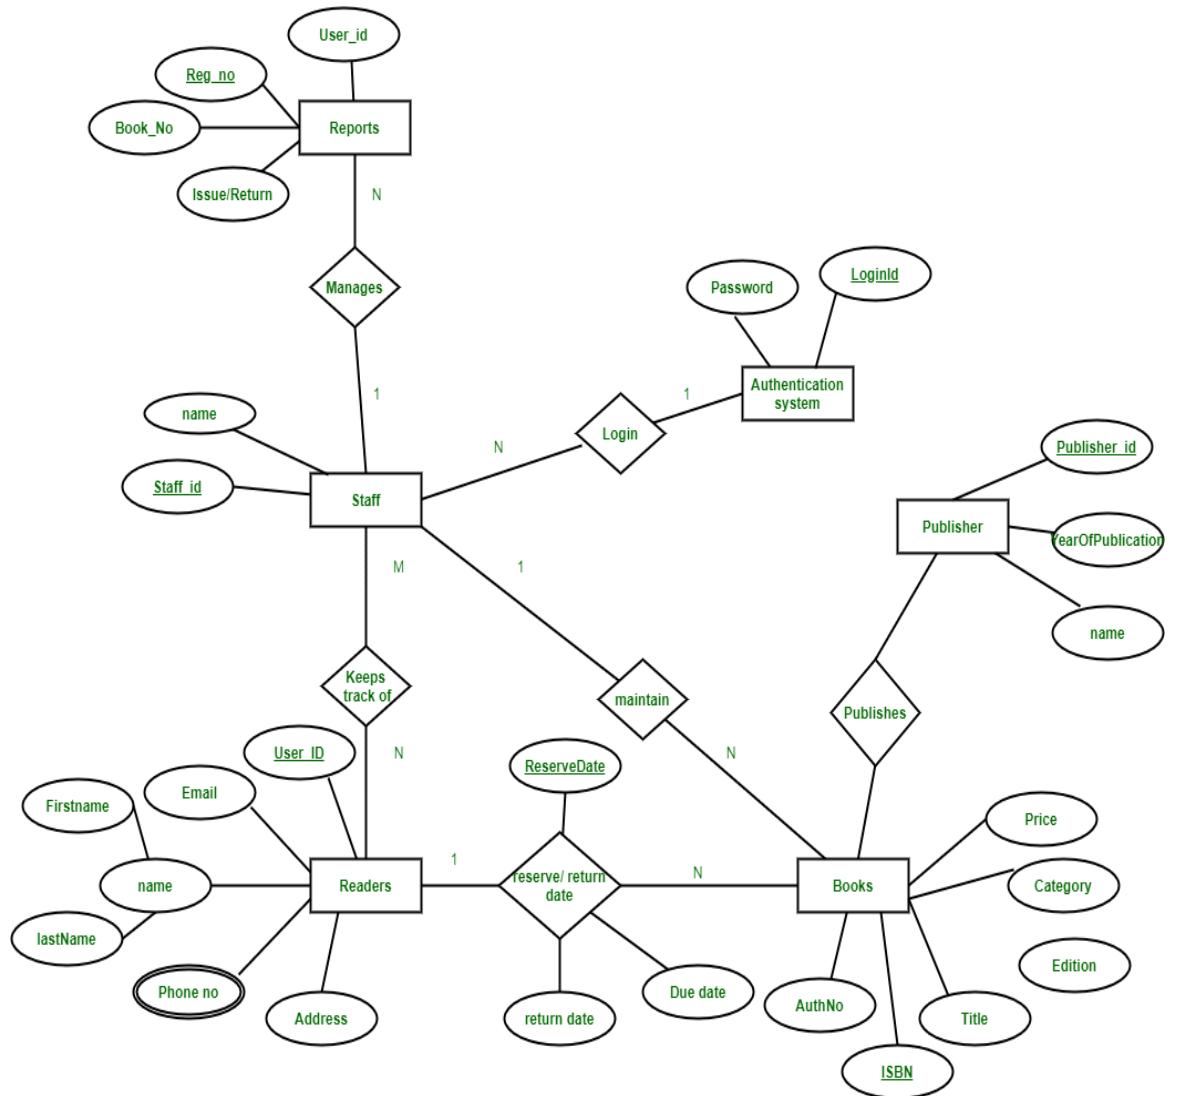

- Admin provides login to multiple staffs. The relation is 1:N.

### **3. Reframing the relations with keys and constraint.**

#### **Sample Output**

- {isbn number} is the Primary Key for Book Entity.
- {authno, isbn number, title} – Super key of Book entity.
- {PublisherId} is the foreign key of Book entity.
- {authno,title} – Candidate key of Book entity.
- UserId is the Primary Key for Readers entity.
- PublisherID is the Primary Key for Publisher entity
- LoginID as Primary Key for Authentication system entity.
- Reg\_no is the Primary Key of reports entity.

- **Using creatively, develop ER diagram.**

**RESULT:** The task to create an E-R diagram of library management system is executed successfully.

## **TASK 2 - GENERATING DESIGN OF OTHER TRADITIONAL DATABASE MODEL**

**Title:** Implementation of DDL commands of SQL with suitable examples.

- Create table
- Alter table
- Drop Table

### **Objective**

To understand the different issues involved in the design and implementation of a database system

### **Theory**

Oracle has many tools such as SQL \* PLUS, Oracle Forms, Oracle Report Writer, Oracle Graphics etc SQL \* PLUS .The SQL \* PLUS tool is made up of two distinct parts. These are

- **Interactive SQL:** Interactive SQL is designed for create, access and manipulate data structures like tables and indexes.
- **PL/SQL:** PL/SQL can be used to developed programs for different applications.
  - Oracle Forms:** This tool allows you to create a data entry screen along with the suitable menu objects. Thus it is the oracle forms tool that handles data gathering and data validation in a commercial application.
  - Report Writer:** Report writer allows programmers to prepare innovative reports using data from the oracle structures like tables, views etc. It is the report writer tool that handles the reporting section of commercial application.
  - Oracle Graphics:** Some of the data can be better represented in the form of pictures. The oracle graphics tool allows programmers to prepare graphs using data from oracle structures like tables, views etc.

### **SQL (Structured Query Language):**

Structured Query Language is a database computer language designed for managing data in relational database management systems (RDBMS), and originally based upon Relational Algebra. Its scope includes data query and update, schema creation and modification, and data access control.

SQL was one of the first languages for Edgar F. Codd's relational model and became the most widely used language for relational databases.

- IBM developed SQL in mid of 1970's.
- Oracle incorporated in the year 1979.
- SQL used by IBM/DB2 and DS Database Systems.
- SQL adopted as standard language for RDBS by ASNI in 1989.

### **DATA TYPES**

- **CHAR (Size):** This data type is used to store character strings values of fixed length. The size in brackets determines the number of characters the cell can hold. The maximum number of character is 255 characters.
- **VARCHAR (Size) / VARCHAR2 (Size):** This data type is used to store variable length alphanumeric data. The maximum character can hold is 2000 character.
- **NUMBER (P, S):** The NUMBER data type is used to store number (fixed or floating point). Number of virtually any magnitude may be stored up to 38 digits of precision. Number as large as  $9.99 * 10^{124}$ . The precision (p) determines the number of places to the right of the decimal. If scale is omitted then the default is zero. If precision is omitted, values are stored with their original precision up to the maximum of 38 digits.
- **DATE:** This data type is used to represent date and time. The standard format is DD-MM-YY as in 17- SEP-2009. To enter dates other than the standard format, use the appropriate functions. Date time stores date in the 24-Hours format. By default the time in a date field is 12:00:00 am, if no time portion is specified. The default date for a date field is the first day the current month.
- **LONG:** This data type is used to store variable length character strings containing up to 2GB. Long data can be used to store arrays of binary data in ASCII format. LONG values cannot be indexed, and the normal character functions such as SUBSTR cannot be applied.
- **RAW:** The RAW data type is used to store binary data, such as digitized picture or image. Data loaded into columns of these data types are stored without any further conversion. RAW data type can have a maximum length of 255 bytes. LONG RAW data type can contain up to 2GB.

#### **SQL language is sub-divided into several language elements, including:**

- **Clauses**, which are in some cases optional, constituent components of statements and queries.
- **Expressions**, which can produce either scalar values or tables consisting of columns and rows of data.
- **Predicates** which specify conditions that can be evaluated to SQL three-valued logic (3VL) Boolean truthvalues and which are used to limit the effects of statements and queries, or to change program flow.
- **Queries** which retrieve data based on specific criteria.
- **Statements** which may have a persistent effect on schemas and data, or which may control transactions, program flow, connections, sessions, or diagnostics.

- SQL statements also include the **semicolon** (";") statement terminator.  
Though not required on every platform, it is defined as a standard part of the SQL grammar.
- **Insignificant white space** is generally ignored in SQL statements and queries, making it easier to format SQL code for readability.

There are five types of SQL statements. They are:

- DATA DEFINITION LANGUAGE (DDL)
- DATA MANIPULATION LANGUAGE (DML)
- DATA RETRIEVAL LANGUAGE (DRL)
- TRANSATIONAL CONTROL LANGUAGE (TCL)
- DATA CONTROL LANGUAGE (DCL)

**1. DATA DEFINITION LANGUAGE (DDL):** The Data Definition Language (DDL) is used to create and destroy databases and database objects. These commands will primarily be used by database administrators during the setup and removal phases of a database project. Let's take a look at the structure and usage of four basic DDL commands:

1. CREATE      2. ALTER      3. DROP      4. RENAME

- **CREATE**

(a) **CREATE TABLE:** This is used to create a new relation (table)

syntax: **CREATE TABLE <relation\_name/table\_name> (field\_1 data\_type(size), field\_2 data\_type(size),);**

**Example:**

create table member(membno int, name varchar(20), department varchar(20), gender varchar(10));

**Member**

membno	name	department	gender
empty			

create table book(isbn int, title varchar(30), authors varchar(10), pagecount int, publisher varchar(10));

**Book**

isbn	title	authors	pagecount	publisher
empty				

create table borrowed(membno int, isbn int, issuedate date);

**Borrowed**

membno	isbn	issuedate
empty		

- **ALTER**

- **ALTER TABLE ...ADD...:** This is used to add some extra fields into existing relation.

**Syntax:** ALTER TABLE relation\_name ADD (new field\_1 data\_type(size), new field\_2 data\_type(size),...);

**Example:** SQL>Alter table borrowed add name VARCHAR(10)

Borrowed			
membno	isbn	issuedate	name
empty			

- **DROP TABLE:** This is used to delete the structure of a relation. It permanently deletes the records in the table.

**Syntax:** DROP TABLE relation\_name;

**Example:** SQL>DROP TABLE borrowed;

- **RENAME:** It is used to modify the name of the existing database object.

**Syntax:** RENAME TABLE old\_relation\_name TO new\_relation\_name;

**Example:** SQL>ALTER TABLE borrowed RENAME COLUMN name to membername;

Borrowed			
membno	isbn	issuedate	membername
empty			

**RESULT:** The task to create, delete and alter the table are executed successfully.

### **TASK 3 - USING CLAUSES, OPERATORS AND FUNCTIONS IN QUERIES**

**Title :** Implementation of DML commands using clauses, operators and functions in queries.

- Insert table
- Select table
- Update table
- Delete Table

**Objective :**

- To understand the different issues involved in the design and implementation of a database system

**Theory:**

**DATA MANIPULATION LANGUAGE (DML):** The Data Manipulation Language (DML) is used to retrieve, insert and modify database information. These commands will be used by all database users during the routine operation of the database. Let's take a brief look at the basic DML commands:

1. INSERT    2. UPDATE    3. DELETE

- **INSERT INTO:** This is used to add records into a relation. There are three types of INSERT INTO queries which are as

- **Inserting a single record**

**Syntax:** INSERT INTO < relation/table name>

(field\_1,field\_2.....,field\_n)VALUES (data\_1,data\_2,,data\_n);

**Example:** SQL> insert into member values(116,'Shan','CSE','male');

Inserting a single record

### Member

membno	name	department	gender
111	jeni	IT	Female
111	Jaz	CSE	Female
113	John	CSE	Female
114	BEn	CSE	Female
115	Ann	CSE	Female
116	Shan	CSE	male

### Borrowed

membno	isbn	issuedate
111	11110	2023-01-02
111	11111	2023-02-05
113	11110	2023-02-07

- **UPDATE-SET-WHERE:** This is used to update the content of a record in a relation.

**Syntax:** SQL>UPDATE relation name SET

Field\_name1=data,field\_name2=data, WHERE field\_name=data;

**Example:** SQL>UPDATE member SET sname = ‘kumar’ WHERE sno=1;

- **DELETE-FROM:** This is used to delete all the records of a relation but it will retain the structure of that relation.

- **DELETE-FROM:** This is used to delete all the records of relation.

**Syntax:** SQL>DELETE FROM relation\_name;

**Example:** SQL>DELETE FROM std;

- **DELETE -FROM-WHERE:** This is used to delete a selected record from a relation.

**Syntax:** SQL>DELETE FROM relation\_name WHERE condition;

**Example:** SQL>DELETE FROM student WHERE sno = 2;

5. **TRUNCATE:** This command will remove the data permanently. But structure will not be removed.

### **Difference between Truncate & Delete**

By using truncate command data will be removed permanently & will not get back whereas by using delete command data will be removed temporally & get back by using roll back command.

By using delete command data will be removed based on the condition whereas by using truncate command there is no condition.

Truncate is a DDL command &

delete is a DML command.

**Syntax:**

TRUNCATE TABLE

<Table name> **Example:**

TRUNCATE TABLE

student;

### **Sample Queries and Output**

- Retrieve member name end with letter ‘n’ and member no between 111 and 115.

**Query:**

```
SELECT first_name, last_name, salary FROM employees  
WHERE first_name LIKE '%n';
```

**Output:**

**Output**

name
John
BEn
Ann

- List the books where pagecount between 700 and 800 – between clause, and operator.

**Query:**

```
select * from book where pagecount between 700 and 800;
```

**Output**

isbn	title	authors	pagecount	publisher
11111	Operating Systems	Silberchatz	750	Mcgraw

- Find the records who has minimum number of pagecount – Aggregate

**Query:**

```
select min(pagecount) from book;
```

**Output**

min(pagecount)
330

- Find the records whose issue date greater than or equal to 07-02-2023

**Query:**

```
select * from borrowed where issuedate >='2023-02-07';
```

**Output**

membno	isbn	issuedate
113	11110	2023-02-07

- List the membno, but the same membno are listed ones.

**Query:**

```
select distinct membno from member;
```

membno
111
113
114
115
116

- Combine the records of member and book relation – Union

**Query:**

```
SELECT membno FROM member UNION SELECT membno FROM
```

**Output**

membno
111
113
114
115
116
117
121

borrowed;

- Groupby the member number based on their gender and department.

**Query**

```
SELECT membno FROM member GROUP BY gender,department;
```

**Output**

membno
111
111
116
117

- Find the authors and their publication details using groupby and orderby clauses.

**Query**

```
SELECT authors,publisher, COUNT( * ) no FROM book GROUP BY authors,
publisher order by authors
```

**Output**

authors	publisher	No
MArk allen	Springer	1
Silberchatz	Mcgraw	1
Silberchatz	Springer	1
William Stallings	Ferrouzan	1

**RESULT:** The task to implement the DML commands are executed successfully.

## **TASK 4 - USING FUNCTIONS IN QUERIES AND WRITING SUBQUERIES**

- A Subquery or Inner query or a Nested query is a query within another SQL query and embedded within the WHERE clause.
- A subquery is used to return data that will be used in the main query as a condition to further restrict the data to be retrieved.
- Subqueries can be used with the SELECT, INSERT, UPDATE, and DELETE statements along with the operators like =, <, >, >=, <=, IN, BETWEEN, etc.

There are a few rules that subqueries must follow –

- Subqueries must be enclosed within parentheses.
- A subquery can have only one column in the SELECT clause, unless multiple columns are in the main query for the subquery to compare its selected columns.
- An ORDER BY command cannot be used in a subquery, although the main query can use an ORDER BY. The GROUP BY command can be used to perform the same function as the ORDER BY in a subquery.
- Subqueries that return more than one row can only be used with multiple value operators such as the IN operator.
- The SELECT list cannot include any references to values that evaluate to a BLOB, ARRAY, CLOB, or NCLOB.
- A subquery cannot be immediately enclosed in a set function.
- The BETWEEN operator cannot be used with a subquery. However, the BETWEEN operator can be used within the subquery.

### **Subqueries with the SELECT Statement**

Syntax:

```
SELECT column_name [, column_name ]
FROM table1 [, table2 ]
WHERE column_name OPERATOR
      (SELECT column_name [, column_name ]
       FROM table1 [, table2 ]
       [WHERE])
```

- Write the subqueries to display the isbn number for the records whose page count is less than 500.

```

SELECT *
FROM book
WHERE isbn IN (SELECT isbn
                FROM book
                WHERE pagecount > 500) ;

```

### Output

isbn	title	authors	pagecount	publisher
1111	OS	Silberchatz	850	springer

- **Select the title and authors whose pagecount is minimum using subquery and functions.**

### Query

```

SELECT title,authors FROM book
WHERE pagecount = (SELECT MIN(pagecount) FROM book)

```

### Output

title	authors
DBMS	Silberchatz

- **Write a subquery to return the values from multiple tables.**

### Query

```

SELECT name, department FROM member WHERE membno == (SELECT isbn
                                                       FROM book)

```

### Output

name	department
jeni	CSE

## Subqueries with the INSERT Statement

```

INSERT INTO table_name [ (column1 [, column2]) ]
    SELECT [*|column1 [, column2]]
        FROM table1 [, table2]
        [ WHERE VALUE OPERATOR ]

```

- **Insert all records in book table into bookduplicate table.**

```

INSERT INTO bookduplicate
    SELECT * FROM book
    WHERE title IN (SELECT title
                    FROM book);

```

### Bookduplicate

isbn	title	authors	pagecount	publisher
111	DBMS	Silberchatz	250	springer
1111	OS	Silberchatz	850	springer

### Subqueries with the UPDATE Statement

Syntax

```
UPDATE table
SET column_name = new_value
[ WHERE OPERATOR [ VALUE ]
  (SELECT COLUMN_NAME
   FROM TABLE_NAME)
[ WHERE) ]
```

- updates pagecount by 2 times in the book table for all the customers whose pagecount is greater than or equal to 300.**

```
UPDATE book SET pagecount = pagecount * 2
               WHERE title IN (SELECT title FROM bookduplicate
               WHERE pagecount <= 300 );
```

### Book

isbn	title	authors	pagecount	publisher
111	DBMS	Silberchatz	500	springer
1111	OS	Silberchatz	850	springer

### Subqueries with the DELETE Statement

```
DELETE FROM TABLE_NAME
[ WHERE OPERATOR [ VALUE ]
  (SELECT COLUMN_NAME
   FROM TABLE_NAME)
[ WHERE) ]
```

- Deletes the records from the member table for all the members whose gender is equal to male.**

```
DELETE FROM member WHERE gender IN (SELECT gender
                                     FROM member WHERE gender == 'male');
Output
```

### **Member**

membno	name	department	gender
111	jeni	CSE	female
112	jaz	IT	female

**RESULT:** The implementation of SQL commands using functions and subqueries is executed successfully.

## **TASK 5 - WRITING JOIN QUERIES, EQUIVALENT, AND/OR RECURSIVE QUERIES**

**Title :** Implementation of different types of Joins and recursive queries.

- A SQL JOIN combines records from two tables.
- A JOIN locates related column values in the two tables.
- A query can contain zero, one, or multiple JOIN operations.
- INNER JOIN is the same as JOIN; the keyword INNER is optional.

### **Aim:**

To implement and execute JOIN queries, equivalent queries, and recursive queries using a university database scenario.

Procedure:

The SQL Joins clause is used to combine records from two or more tables in a database. A JOIN is a means for combining fields from two tables by using values common to each. The join is actually performed by the ‘where’ clause which combines specified rows of tables

- Create the database and tables (Students, Departments, Courses, Enrollments).
- Insert sample data.
- Write SQL queries using different types of **JOINS**.
- Write **equivalent queries** (different approaches to get the same result).
- Implement a **recursive query** (using WITH RECURSIVE).
- Display results and verify correctness.

Step1:

**Syntax:**

```
SELECT column 1, column 2, column 3...FROM table_name1, table_name2  
WHERE table_name1.column name = table_name2.columnname;
```

### **Types of Joins :**

- Simple Join
- Self Join
- Outer Join

#### **Simple Join:**

It is the most common type of join. It retrieves the rows from 2 tables having a common column and is further classified into

#### **Equi-join :**

A join, which is based on equalities, is called equi-join.

#### **Example:**

```
Select * from item, cust where item.id=cust.id;
```

In the above statement, item-id = cust-id performs the join statement. It retrieves rows from both the tables provided they both have the same id as specified by the where clause. Since the where clause uses the comparison operator (=) to perform a join, it is said to be equijoin. It combines the matched rows of tables. It can be used as follows:

- To insert records in the target table.
- To create tables and insert records in this table.
- To update records in the target table.
- To create views.

#### **Non Equi-join:**

It specifies the relationship between columns belonging to different tables by making use of relational operators other than '='.

#### **Example:**

```
Select * from item, cust where item.id<cust.id;
```

### **Table Aliases**

Table aliases are used to make multiple table queries shorter and more readable. We give an alias name to the table in the 'from' clause and use it instead of the name throughout the query.

#### **Self join:**

Joining of a table to itself is known as self-join. It joins one row in a table to another.

It can compare each row of the table to itself and also with other rows of the same table.

#### Example:

```
select * from emp x ,emp y where x.salary >= (select avg(salary) from x.emp  
where x. deptno  
=y.deptno);
```

#### Outer Join:

It extends the result of a simple join. An outer join returns all the rows returned by simple join as well as those rows from one table that do not match any row from the table. The symbol (+) represents outer join.

#### Different Types of SQL JOINS

Here are the different types of the JOINS in SQL:

- **(INNER) JOIN:** Returns records that have matching values in both tables

```
SELECT column_name(s) FROM table1
```

```
INNER JOIN table2 ON table1.column_name = table2.column_name;
```

- **LEFT (OUTER) JOIN:** Return all records from the left table, and the matched records from the right table.

```
SELECT column_name(s) FROM table1
```

```
LEFT JOIN table2 ON table1.column_name = table2.column_name;
```

- **RIGHT (OUTER) JOIN:** Return all records from the right table, and the matched records from the left table.

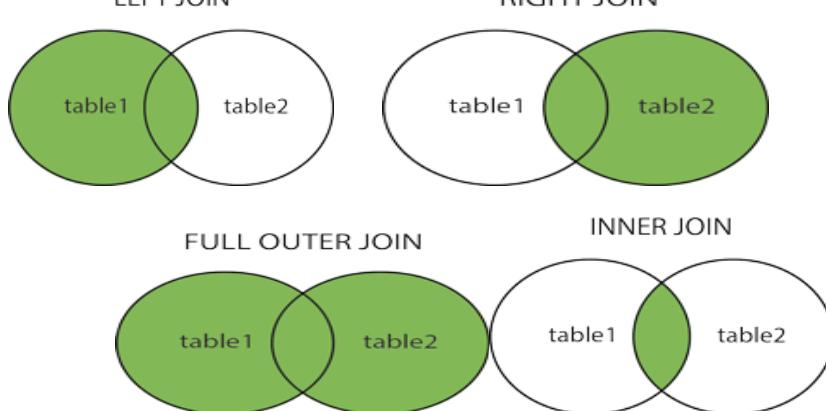

```
SELECT column_name(s) FROM table1
```

```
RIGHT JOIN table2 ON table1.column_name = table2.column_name;
```

- **FULL (OUTER) JOIN:** Return all records when there is a match in either left or right table

```
SELECT column_name(s) FROM table1
```

```
FULL OUTER JOIN table2 ON table1.column_name = table2.column_name;
```

The SQL Joins clause is used to combine records from two or more tables in a database. A JOIN is amean for combining fields from two tables by using values common to each.

Consider the following two tables –

### Inner Join

The INNER JOIN keyword selects all rows from both tables as long as the condition is satisfied. This keyword will create the result-set by combining all rows from both the tables where the condition satisfies.

Syntax

```
SELECT column_name(s)
FROM table1
INNER JOIN table2
ON table1.column_name = table2.column_name;
```

Query

```
SELECT borrowed.membno, member.NAME FROM member
INNER JOIN borrowed
ON member.membno = borrowed.membno;
```

#### Output

membno	name
111	jeni

### Left Join

The **LEFT JOIN** keyword returns all records from the left table (table1), and the matching records from the right table (table2).

Syntax

```
SELECT column_name(s)
FROM table1
LEFT JOIN table2
ON table1.column_name = table2.column_name;
```

Query

```
SELECT member.NAME, borrowed.membno FROM member
LEFT JOIN borrowed ON borrowed.membno = member.membno;
```

### SQL RIGHT JOIN Keyword

The **RIGHT JOIN** keyword returns all records from the right table (table2), and the matching records from the left table (table1).

Syntax

```
SELECT column_name(s)
FROM table1
```

```
RIGHT JOIN table2  
ON table1.column_name = table2.column_name;
```

## SQL FULL OUTER JOIN Keyword

The **FULL OUTER JOIN** keyword returns all records when there is a match in left (table1) or right (table2) table records.

**Tip:** **FULL OUTER JOIN** and **FULL JOIN** are the same.

Syntax :

```
SELECT column_name(s)  
FROM table1  
FULL OUTER JOIN table2  
ON table1.column_name = table2.column_name  
WHERE condition;
```

## Recursive Queries

Syntax

```
WITH RECURSIVE [cte_name] (column, ...) AS (  
    [non-recursive_term]  
    UNION ALL  
    [recursive_term])  
SELECT ... FROM [cte_name];
```

1 : Write a recursive query to create a Multiplication table by 2

```
WITH RECURSIVE x2 (result) AS (  
    SELECT 1  
    UNION ALL  
    SELECT result*2 FROM x2)  
SELECT * FROM x2 LIMIT 10;
```

Output

```
result
```

```
-----  
1  
2  
4  
8  
16  
32  
64  
128  
256  
512
```

(10 rows)

Example 2 - Write a recursive query to create a Fibonacci sequence.

```
WITH RECURSIVE fib(f1, f2) AS (
```

```
    SELECT 0, 1
    UNION ALL
    SELECT f2, (f1+f2) FROM fib )
SELECT f1 FROM fib LIMIT 10;
```

```
f1
```

```
---
```

```
0
1
1
2
3
5
8
13
21
34
```

(10 rows)

Result:

The implementation of SQL commands using Joins and recursive queries are executed successfully.

### Task -6 PL/SQL Procedures, functions, Loops

**Aim:**

To implement PL/SQL Procedures, Functions and loops on Number theory and business scenarios.

**Procedure:**

PL/SQL is a combination of SQL along with the procedural features of programming languages.

It was developed by Oracle Corporation in the early 90's to enhance the capabilities of SQL. PL/SQL is one of three key programming languages embedded in the Oracle Database, along with SQL itself and Java.

S.No	Sections & Description

1	<b>Declarations</b> This section starts with the keyword <b>DECLARE</b> . It is an optional section and defines all variables, cursors, subprograms, and other elements to be used in the program.
2	<b>Executable Commands</b> This section is enclosed between the keywords <b>BEGIN</b> and <b>END</b> and it is a mandatory section. It consists of the executable PL/SQL statements of the program. It should have at least one executable line of code, which may be just a <b>NULL command</b> to indicate that nothing should be executed.
3	<b>Exception Handling</b> This section starts with the keyword <b>EXCEPTION</b> . This optional section contains <b>exception(s)</b> that handle errors in the program.

Simple program to print a sentence:

Syntax:

```
DECLARE
    <declarations section>
BEGIN
    <executable command(s)>
EXCEPTION
    <exception handling>
END;
```

Program:

```
DECLARE
    message  varchar2(20) := 'booking closed';
BEGIN
    dbms_output.put_line(message);
END;
```

Static input:

```
SQL> set serveroutput on
SQL> declare
  2  x number(5);
  3  y number(5);
  4  z number(9);
  5  begin
  6  x:=10;
  7  y:=12;
  8  z:=x+y;
  9  dbms_output.put_line('sum is' ||z);
10 end;
11 /
sum is22
```

PL/SQL procedure successfully completed.

Dynamic Input:

```
SQL> declare
  2  var1 integer;
  3  var2 integer;
  4  var3 integer;
  5  begin
  6  var1:=&var1;
  7  var2:=&var2;
  8  var3:= var1+var2;
  9  dbms_output.put_line(var3);
10 end;
11 /
Enter value for var1: 20
old   6: var1:=&var1;
new   6: var1:=20;
Enter value for var2: 30
old   7: var2:=&var2;
new   7: var2:=30;
50

PL/SQL procedure successfully completed.
```

```
DECLARE
    hid number(3) := 100;
BEGIN
    IF ( hid = 10 ) THEN
        dbms_output.put_line('Value of hid is 10'
```

```

) ;
ELSIF ( hid = 20 ) THEN
    dbms_output.put_line('Value of hid is 20'
);
ELSIF ( hid = 30 ) THEN
    dbms_output.put_line('Value of hid is 30'
);
ELSE
    dbms_output.put_line('None of the values
is matching');
END IF;
dbms_output.put_line('Exact value of hid is:
' || hid );
END;
/

```

None of the values is matching  
Exact value of hid is: 100

PL/SQL procedure successfully completed.

```

DECLARE
    hid number(1);
    oid number(1);
BEGIN
    << outer_loop >>
    FOR hid IN 1..3 LOOP
        << inner_loop >>
        FOR oid IN 1..3 LOOP
            dbms_output.put_line('hid is: ' || hid || ' and oid is: '
|| oid);
        END loop inner_loop;
    END loop outer_loop;
END;
/

```

hid is: 1 and oid is: 1  
hid is: 1 and oid is: 2  
hid is: 1 and oid is: 3  
hid is: 2 and oid is: 1  
hid is: 2 and oid is: 2  
hid is: 2 and oid is: 3  
hid is: 3 and oid is: 1  
hid is: 3 and oid is: 2  
hid is: 3 and oid is: 3

PL/SQL procedure successfully completed.

### Sample program for only procedure:

```

SQL> create or replace procedure csinformation
  2  (c_id in number, c_name in varchar2)
  3  is
  4  begin
  5    dbms_output.put_line('ID: '||c_id);
  6    dbms_output.put_line('Name: '||c_name);
  7  end;
  8  /
Procedure created.

SQL> exec csinformation(101,'raam');

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL> exec csinformation(101,'raam');
ID: 101
Name: raam

PL/SQL procedure successfully completed.

```

Sample program for only function:

```

SQL>create or replace function csinformation
(h_id in number,c_name in varchar2)
Return varchar2
Is
Begin
If c_id>200 then
Return('no booking available');
Else
Return('booking open');
End if;
End;
/
Function created.

```

```

SQL> declare
 2  mesg varchar2(200);
 3  begin
 4  mesg :=csinformation2(102,'raam');
 5  dbms_output.put_line(mesg);
 6  end;
 7 /
vehicle available

```

```

SQL> declare
 2  mesg varchar2(200);
 3  begin
 4  mesg :=csinformation2(206,'raam');
 5  dbms_output.put_line(mesg);
 6  end;
 7 /
No vehicle available
PL/SQL procedure successfully completed.

```

## TASK 7

### Sample program for only Loops

- To print prime number customer id using loops

```

SQL> declare
 2  lo number<3>;
 3  hi number<3>;
 4  n number<2>;
 5  m number<2>;
 6  c number<20>;
 7  begin
 8  dbms_output.put_line('enter the customer id from to limit:');
 9  lo:=&lo;
10  hi:=&hi;
11  for n in lo.. hi
12  loop
13  c:=0;
14  for m in 1..n
15  loop
16  if mod<n,m>=0 then
17  c:=c+1;
18  end if;
19  end loop;
20  if c<=2 then
21  dbms_output.put_line(n||'\n');
22  end if;
23  end loop;
24  end;
25 /
Enter value for lo: 101
old   9: lo:=&lo;
new   9: lo:=101;
Enter value for hi: 120
old  10: hi:=&hi;
new  10: hi:=120;
enter the customer id from to limit:
101\n
103\n
107\n
109\n
113\n
PL/SQL procedure successfully completed.

```

- To check the given customer booking number is Armstrong number.

```
SQL> declare
2   bk number<5>;
3   s number:=0;
4   r number;
5   len number;
6   m number;
7   begin
8     bk:=&bk;
9     m:=bk;
10    len:=length(to_char(bk));
11    while bk>0
12    loop
13      r:=mod(bk,10);
14      s:=s+power(r,len);
15      bk:=trunc(bk/10);
16    end loop;
17    if
18      m=s
19    then
20      dbms_output.put_line('given number is armstrong');
21    else
22      dbms_output.put_line('given number is not an armstrong');
23    end if;
24  end;
25 /
Enter value for bk: 234
old  8: bk:=&bk;
new  8: bk:=234;
given number is not an armstrong
```

```
as
Enter value for bk: 1634
old  8: bk:=&bk;
new  8: bk:=1634;
given number is armstrong
PL/SQL procedure successfully completed.
```

## **TASK 8: Normalizing databases using functional dependencies upto BCNF**

**(Tool: GU/ Table Normalization Tool, ALM:Jigsaw) CO3, K3**

Upon relational tables created in task-2, perform normalization up to BCNF based on given Dependencies as following for the assumed relations specified below.

Employee Database:

1. Identify employee attributes: Employee\_ID, Name, Department, Job\_Title, Manager\_ID, Hire\_Date, Salary.
2. Define relational schema: Employee (Employee\_ID, Name, Department, Job\_Title, Manager\_ID, Hire\_Date, Salary).
3. Determine functional dependencies (FDs) between attributes:
  - Employee\_ID  $\rightarrow$  Name, Department, Job\_Title, Manager\_ID, Hire\_Date, Salary
  - Department  $\rightarrow$  Manager\_ID
  - Manager\_ID  $\rightarrow$  Name

Step 2: Convert to 1NF

1. Eliminate repeating groups or arrays (none in this example).
2. Create separate tables for each repeating group (none in this example).

Step 3: Convert to 2NF

1. Ensure each non-key attribute depends on the entire primary key.
2. Move non-key attributes to separate tables if they depend on only part of the primary key.
  - Create Department table: Department (Department\_ID, Manager\_ID, Name).
  - Create Employee table: Employee (Employee\_ID, Name, Department\_ID, Job\_Title, Hire\_Date, Salary).

Step 4: Convert to 3NF

1. Ensure there are no transitive dependencies.
2. Move non-key attributes to separate tables if they depend on another non-key attribute.
  - Create Manager table: Manager (Manager\_ID, Name).
  - Update Department table: Department (Department\_ID, Manager\_ID).

## Step 5: Convert to BCNF

1. Ensure every determinant is a candidate key.
  2. Check for overlapping candidate keys.
  3. Decompose relations to eliminate redundancy.
- No further decomposition needed.

## Using Griffith Tool

1. Input relational schema and functional dependencies.
2. Griffith tool generates a dependency graph.
3. Analyze the graph to identify normalization issues.
4. Apply normalization rules to transform the schema.
5. Verify the resulting schema meets BCNF criteria.

## Griffith Tool Steps

1. Create a new project in Griffith.
2. Define the relational schema and FDs.
3. Run the "Dependency Graph" tool.
4. Analyze the graph for normalization issues.
5. Apply transformations using the "Normalize" tool.
6. Verify BCNF compliance using the "BCNF Check" tool.

## Normalized Schema

1. Employee (Employee\_ID, Name, Department\_ID, Job\_Title, Hire\_Date, Salary).
2. Department (Department\_ID, Manager\_ID).
3. Manager (Manager\_ID, Name).

## TASK 9: Backing up and recovery in databases CO4, K3

Perform following backup and recovery scenarios.

- a. Recovering a NOARCHIVELOG Database with Incremental Backups
- b. Restoring the Server Parameter File
- c. Performing Recovery with a Backup Control File

## **Scenario 1: Recovering a NOARCHIVELOG Database with Incremental Backups**

-- Step 1: Backup Database

```
BACKUP DATABASE [database_name] TO DISK = 'backup_file.bak' WITH  
NOFORMAT, NOINIT, NAME = 'Full Database Backup', SKIP, REWIND,  
NOUNLOAD, STATS = 10
```

-- Step 2: Create Incremental Backup

```
BACKUP DATABASE [database_name] TO DISK = 'incremental_backup.bak'  
WITH DIFFERENTIAL, NOFORMAT, NOINIT, NAME = 'Incremental  
Database Backup', SKIP, REWIND, NOUNLOAD, STATS = 10
```

-- Step 3: Simulate Data Loss

-- Intentionally delete or modify data.

-- Step 4: Restore Database

```
RESTORE DATABASE [database_name] FROM DISK = 'backup_file.bak'  
WITH REPLACE
```

-- Step 5: Apply Incremental Backup

```
RESTORE DATABASE [database_name] FROM DISK =  
'incremental_backup.bak' WITH REPLACE
```

-- Step 6: Recover Database

```
RECOVER DATABASE [database_name]
```

-- Step 7: Open Database

```
ALTER DATABASE [database_name] SET ONLINE
```

## **Scenario 2: Restoring the Server Parameter File (SPFILE)**

-- Step 1: Backup SPFILE

```
BACKUP SERVER PARAMETER FILE TO FILE = 'spfile.bak';
```

-- Step 2: Simulate SPFILE Loss

-- Delete or modify SPFILE.

-- Step 3: Restore SPFILE

```
STARTUP MOUNT
```

```
RESTORE SERVER PARAMETER FILE FROM FILE = 'spfile.bak';
```

```
SHUTDOWN
```

```
STARTUP
```

## **Scenario 3: Performing Recovery with a Backup Control File**

-- Step 1: Backup Control File  
BACKUP CONTROLFILE TO FILE = 'controlfile.bak';

-- Step 2: Simulate Control File Loss  
-- Delete or modify control file.

-- Step 3: Restore Control File  
STARTUP MOUNT  
RESTORE CONTROLFILE FROM FILE = 'controlfile.bak';  
ALTER CONTROLFILE REUSE;

-- Step 4: Recover Database  
RECOVER DATABASE USING BACKUP CONTROLFILE;

-- Step 5: Open Database  
ALTER DATABASE OPEN RESETLOGS;

SQL Server Commands:

- BACKUP DATABASE
- RESTORE DATABASE
- RECOVER DATABASE
- ALTER DATABASE
- BACKUP SERVER PARAMETER FILE
- RESTORE SERVER PARAMETER FILE
- BACKUP CONTROLFILE
- RESTORE CONTROLFILE

**Result:**

## **TASK 10- CRUD OPERATIONS IN DOCUMENT DATABASES**

### **AIM:**

To Perform Mongoose using NPM design on MongoDB designing document database and performing CRUD operations like creating, inserting, querying, finding and removing operations.

### **STEPS:**

Step 1)install Mongo db using following link

<https://www.mongodb.com/try/download/community>

Step 2)install Mongosh using the below link

<https://www.mongodb.com/docs/mongodb-shell/#download-and-install-mongosh>

Step 3)To add the MongoDB Shell binary's location to your PATH environment variable:

Open the Control Panel.

In the System and Security category, click System.

Click Advanced system settings. The System Properties modal displays.

Click Environment Variables.

In the System variables section, select path and click Edit. The Edit environment variable modal displays.

Click New and add the filepath to your mongosh binary.

Click OK to confirm your changes. On each other modal, click OK to confirm your changes.

To confirm that your PATH environment variable is correctly configured to find mongosh, open a command prompt and enter the mongosh --help command.

If your PATH is configured correctly, a list of valid commands displays.

Step 4)Open mongo shell 4.0 from

c:\programfiles\mongoDB\server\bin\mongod.exe

Step 5)Type the CRUD(CREATE READ UPDATE DELETE) COMMANDS GIVEN IN TEXT FILE.

## CRUD OPERATIONS

```
db.createCollection("mylab")
{
  "ok" : 1
}
>
db.mylab.insertOne({item:"canvas",qty:100,tags:["cotton"],size:{h:28,w:35.5,uom:"cm"})
{
  "acknowledged" : true,
  "insertedId" : ObjectId("627d13acc73990c074e6397c")
}
> db.mylab.find({item:"canvas"})
{
  "_id" : ObjectId("627d13acc73990c074e6397c"),
  "item" : "canvas",
  "qty" : 100,
  "tags" : [ "cotton" ],
  "size" : { "h" : 28, "w" : 35.5, "uom" : "cm" }
}
>
db.mylab.insertMany([
  {item:"journal",qty:25,tags:["blank","red"],size:{h:14,w:21,uom:"cm"}},
  {item:"mat",qty:85,tags:["gray"],size:{h:27.9,w:35.5,uom:"cm"}}
])
```

```

    }}, {item:"mousepad", qty:25, tags:["gel", "blue"], size:{h:19, w:22.85, uom:"cm"} }
  ])
{
  "acknowledged" : true,
  "insertedIds" : [
    ObjectId("627d1598c73990c074e6397d"),
    ObjectId("627d1598c73990c074e6397e"),
    ObjectId("627d1598c73990c074e6397f")
  ]
}
> db.mylab.find({}, {item:1,qty:1})
{ "_id" : ObjectId("627d13acc73990c074e6397c"), "item" : "canvas", "qty" :
100 }
{ "_id" : ObjectId("627d1598c73990c074e6397d"), "item" : "journal", "qty" :
25 }
{ "_id" : ObjectId("627d1598c73990c074e6397e"), "item" : "mat", "qty" : 85 }
{ "_id" : ObjectId("627d1598c73990c074e6397f"), "item" : "mousepad", "qty" :
25 }
> db.mylab.find({}, {item:1,qty:1}).pretty()
{

```

### **Result:**

The implementation of CRUD operations like creating, inserting, finding and removing operations using MongoDB is successfully executed.

## **TASK 11- CRUD OPERATIONS IN GRAPH DATABASES**

### **AIM:**

To perform CRUD operations like creating, inserting, querying, finding, deleting operations on graph spaces.

- Create Node with Properties**

Properties are the key-value pairs using which a node stores data. You can create a node with properties using the CREATE clause. You need to specify these properties separated by commas within the flower braces “{ }”.

## Syntax

Following is the syntax to create a node with properties.

```
CREATE (node:label { key1: value, key2: value, ..... })
```

- **Returning the Created Node**

To verify the creation of the node, type and execute the following query in the dollar prompt.

```
MATCH (n) RETURN n
```

- **Creating Relationships**

We can create a relationship using the CREATE clause. We will specify relationship within the square braces “[ ]” depending on the direction of the relationship it is placed between hyphen “ - ” and arrow “ → ” as shown in the following syntax.

## Syntax

Following is the syntax to create a relationship using the CREATE clause.

```
CREATE (node1)-[:RelationshipType]->(node2)
```

- **Creating a Relationship Between the Existing Nodes**

You can also create a relationship between the existing nodes using the MATCH clause.

## Syntax

Following is the syntax to create a relationship using the MATCH clause.

```
MATCH (a:LabeofNode1), (b:LabeofNode2)  
WHERE a.name = "nameofnode1" AND b.name = " nameofnode2"  
CREATE (a)-[: Relation]->(b)  
RETURN a,b
```

- **Deleting a Particular Node**

To delete a particular node, you need to specify the details of the node in the place of “n” in the above query.

## Syntax

Following is the syntax to delete a particular node from Neo4j using the DELETE clause.

```
MATCH (node:label {properties ..... })  
DETACH DELETE node
```

**Create a graph database for student course registration, create student and dept node and insert values of properties.**

```
create(n:student{Sid: "VTU14500",
Sname:"John",
deptname:"CSE" }
)
```

### **OUTPUT**

Added 1 label, created 1 node, set 3 properties, completed after 232 ms.

```
Create(n:student {Sid: "VTU14501",
Sname:"Dharsana",
deptname:"EEE"})
```

### **OUTPUT**

Added 1 label, created 1 node, set 3 properties, completed after 16 ms.

```
Create(w:student { Sid: "VTU14502",
Sname:"vijay",
deptname:"CSE"
})
```

### **OUTPUT**

Added 1 label, created 1 node, set 3 properties, completed after 12 ms.

```
Create(n:dept{deptname:"cse",deptid:"d001"})
```

### **OUTPUT:**

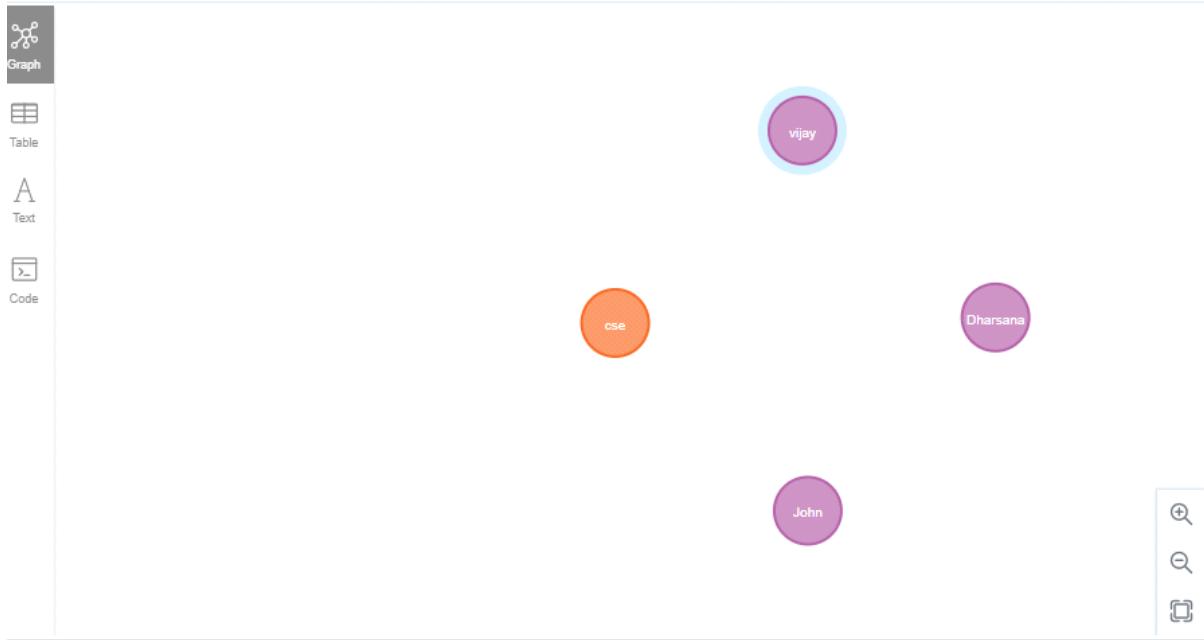

Added 1 label, created 1 node, set 2 properties, completed after 72 ms.

**Select all the nodes in your database using match command**

- **match(n) return(n)**

### **OUTPUT**

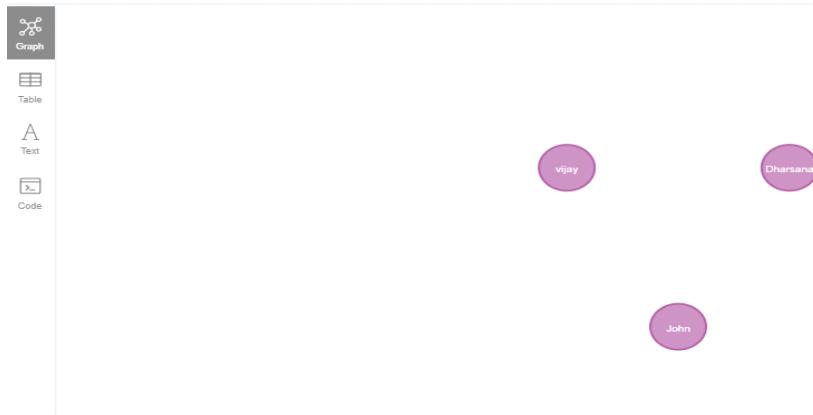

```
neo4j$ match(n) return(n)
```

- **match(n:student) return(n)**

## OUTPUT:

```
neo4j$ match(n:student) return(n)
```

- a. **Create relationship between student and cse .**

```
MATCH(s:student),(d:dept) WHERE s.Sname ='vijay' AND d.deptname='cse'  
CREATE(s)-[st:STUDIED_AT]->(d)  
return s,d
```

## OUTPUT:

```

1 MATCH(s:student),(d:dept) WHERE s.Sname ='vijay' AND d.deptname='cse'
2 CREATE(s)-[st:STUDIED_AT]-(d)
3 return s,d
4
5
6
7
8

```

Graph

Table

Text

Warn

Code

```

MATCH(s:student),(d:dept) WHERE s.Sname ='John' AND d.deptname='cse'
CREATE(s)-[st:STUDIED_AT]-(d)
return s,d

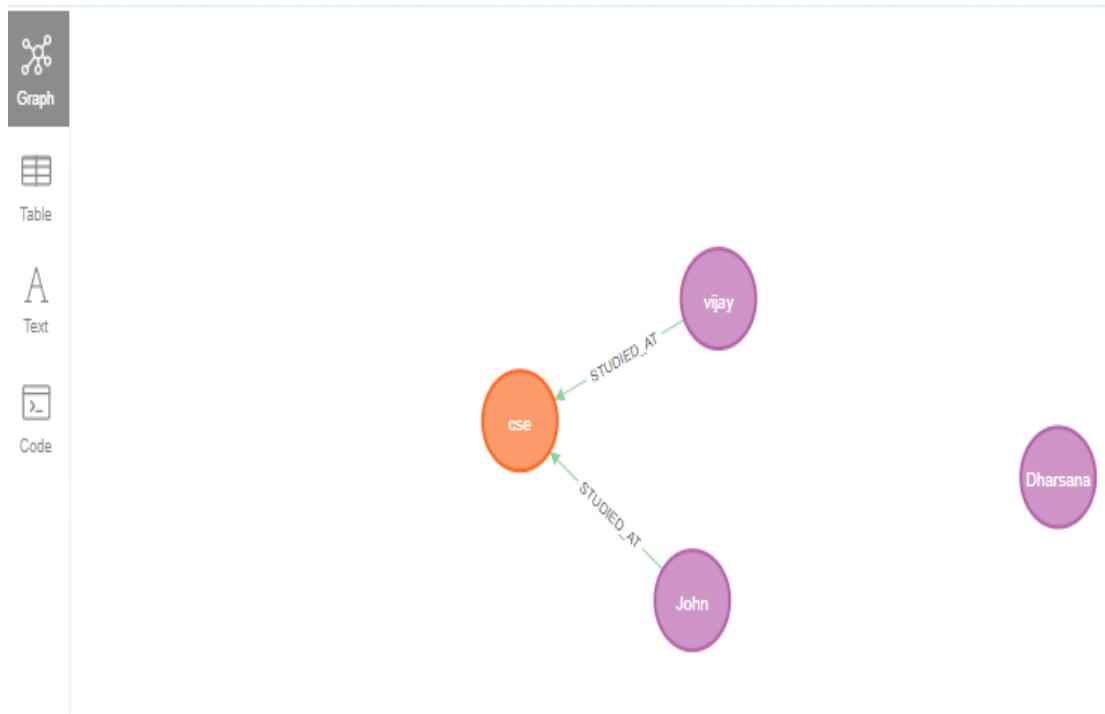

```

OUTPUT:

**match(n) return(n)**

```
neo4j$ match(n) return(n)
```

### a. Delete a node from student

```
match(n:student{Sname:'Dharsana'}) DELETE(n)
```

### OUTPUT:

Deleted 1 node, completed after 10834 ms.

```
neo4j$ match(n) return(n)
```

## **Result**

The implementation of CRUD operations like creating, inserting, finding and removing operations using GraphDB is successfully executed.

## **TASK 12: MINI PROJECT**

### **TITLE**

### **BUS MANAGEMENT SYSTEM**

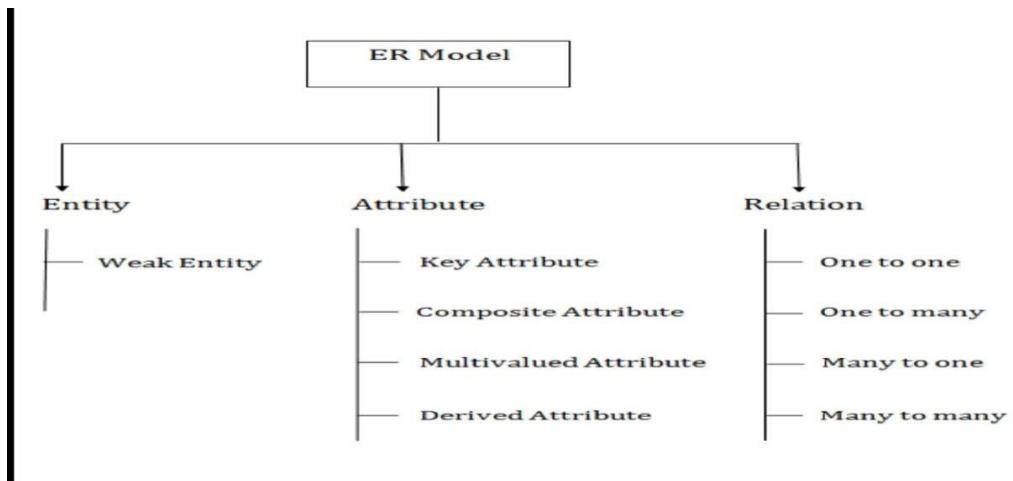

#### **1.ER Diagram:**

Aim : To draw the conceptual design for Bus management system

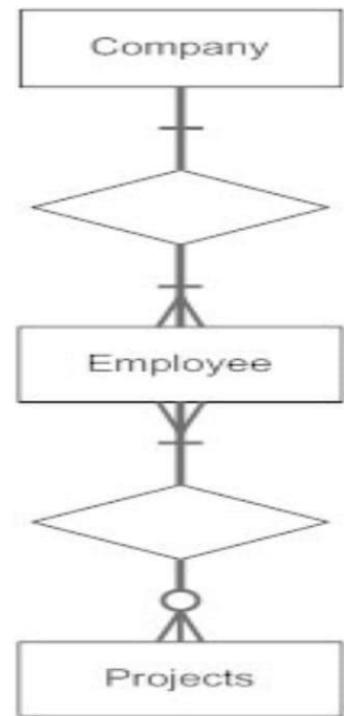

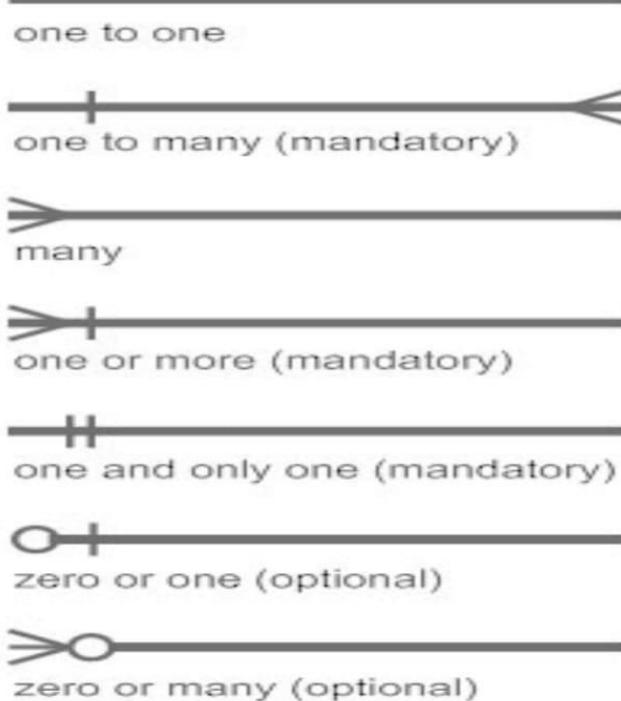

#### **E-R Diagram**

Entity–Relationship model:

- ER model stands for an Entity-Relationship model. It is a highlevel data model. This model is used to define the data elements and relationship for a specified system.
- It develops a conceptual design for the database. It also develops a very simple and easy to design view of data
- It develops a conceptual design for the database. It also develops a very simple and easy to design view of data

Entity Set	Strong Entity Set	
	Weak Entity Set	
Attributes	Simple Attribute	
	Composite Attribute	
	Single-valued Attribute	
	Multivalued Attribute	
	Derived Attribute	
	Null Attribute	
	Strong Relationship	
Relationship	Weak Relationship	

The weak entity doesn't contain any key attribute of its own. The weak entity is represented by a double rectangle.

**ATTRIBUTE:** The attribute is used to describe the property of an entity. Eclipse is used to represent an attribute

**KEY ATTRIBUTE:** The key attribute is used to represent the main characteristics of an entity. It represents a primary key. The key attribute is represented by an ellipse with the text underlined.

**COMPOSITE ATTRIBUTE:** An attribute that is composed of many other attributes is known as a composite attribute. The composite attribute is represented by an ellipse, and those ellipses are connected with an ellipse.

**MULTI VALUED ATTRIBUTE :** An attribute can have more than one value. These attributes are known as a multivalued attribute. The double oval is used to represent multivalued attribute.

**DERIVED ATTRIBUTE:** Attributes which are derived from other attributes

## ER-MODEL FOR BUS MANAGEMENT SYSTEM

**Entities:** Bus,Driver,Route,Schedule,Ticket **Attributes:**

- Bus: Bus\_id, Licence\_plate, Model, Capacity
- Driver: Driver\_id, Name, Licence\_plate
- Route: Route\_id, Start\_location, End\_location, Distance\_km
- Schedule:Schedule\_id,Bus\_id,Route\_id,Departure\_time,  
Arrival\_time

**Relations:**

1. Operates (between Bus and Route):

- Foreign Key: Route\_Id in the Route entity

2. Assigned to Relation (between Bus and Driver):

- Foreign Key: Driver\_id in the Driver entity

3. Scheduled to Relation (between Schedule ,Bus, Route):

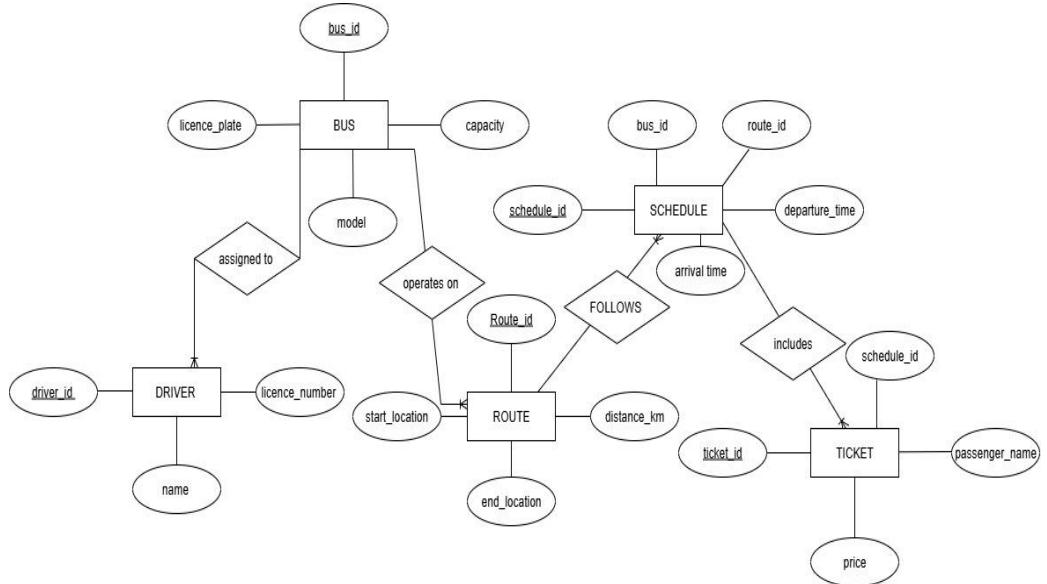

- Foreign Key: Bus\_id in the Bus entity
- Foreign Key: Route\_id in the Route entity

4. For Relation(between Ticket ,Schedule):

- Foreign Key: Schedule\_id in the Schedule entity

RELATIONAL MODEL FOR BUS MANAGEMENT SYSTEM

## ER DIAGRAM FOR BUS MANAGEMENT SYSTEM

**Result:** Thus, the creating er diagram is completed successfully.

**Aim:** To execute relational operations, SQL aggregates, Joint queries for Bus Management System

### Relational operations:

#### i. Select operation:

```
SQL> SELECT *
2  FROM BUS
3  WHERE capacity > 45;
-----  
BUS_ID LICENCE_PLATE  
MODEL  
ROUTE_ID  
-----  
301 TN01AB1234  
Volvo 9700  
201  
50 101  
303 TN03EF9012  
Scania Touring  
203  
55 103  
-----  
BUS_ID LICENCE_PLATE  
MODEL  
ROUTE_ID  
-----  
305 TN05IJ7890  
Tata Starbus  
205  
48 105
```

#### ii. Project operation:

```
SQL> SELECT model, capacity
2  FROM BUS;  
-----  
MODEL CAPACITY  
-----  
Volvo 9700 50  
Mercedes Tourismo 45  
Scania Touring 55  
Ashok Leyland 40  
Tata Starbus 48
```

#### iii. Union:

```
SQL> SELECT bus_id, model AS name_or_model FROM BUS WHERE capacity > 50
2 UNION
3  SELECT route_id, start_location || '-' || end_location FROM ROUTE WHERE distance_km > 400;
-----  
BUS_ID  
NAME_OR_MODEL  
-----  
202 Bangalore-Hyderabad  
203 Hyderabad-Mumbai  
205 Pune-Goa  
-----  
BUS_ID  
NAME_OR_MODEL  
-----  
303 Scania Touring
```

#### iv. SET INTERSECTION

```

SQL> SELECT bus_id FROM BUS WHERE bus_id > 302
2 INTERSECT
3 SELECT bus_id FROM BUS WHERE bus_id < 305;

    BUS_ID
-----
303
304

```

## v. SET DIFFERENCE

```

SQL> -- Bus IDs greater than 301 but not greater than 303
SQL> SELECT bus_id FROM BUS WHERE bus_id > 301
2 MINUS
3 SELECT bus_id FROM BUS WHERE bus_id > 303;

    BUS_ID
-----
302
303

```

## SQL Aggregate

### i. Count:

```

mysql> SELECT d.name AS driver_name,COUNT(B.bus_id)AS total_buses_assigned FROM DRIVER D JOIN BUS B ON D.driver_id=B.driver_id group by D.name;
+-----+-----+
| driver_name | total_buses_assigned |
+-----+-----+
| rajesh kumar | 1 |
| suresh reddy | 1 |
| anil sharma | 1 |
| vijay patel | 1 |
| karthick rao | 1 |
+-----+-----+

```

```

mysql> SELECT R.route_id,R.start_location||'-'||R.end_location AS route_name,SUM(T.price)AS total_revenue FROM ROUTE R JOIN SCHEDULE S ON R.route_id=S.route_id JOIN TICKET T ON S.schedule_id=T.schedule_id GROUP BY R.route_id,R.start_location,R.end_location;
+-----+-----+-----+
| route_id | route_name | total_revenue |
+-----+-----+-----+
| 201 | 0 | 500.00 |
| 202 | 0 | 450.00 |
| 203 | 0 | 550.00 |
| 204 | 0 | 400.00 |
| 205 | 0 | 480.00 |
+-----+-----+-----+
5 rows in set, 13 warnings (0.10 sec)

```

### iii. Average:

```
mysql> SELECT route_id,start_location,end_location,distance_km FROM ROUTE WHERE distance_km >(SELECT AVG(distance_km) FROM ROUTE);
+-----+-----+-----+
| route_id | start_location | end_location | distance_km |
+-----+-----+-----+
|    202 | banglore      | hyderabad    |      580 |
|    203 | hyderabad     | mumbai       |      710 |
|    205 | pune          | goa          |      450 |
+-----+-----+-----+
3 rows in set (0.01 sec)
```

#### iv. Maximum:

```
mysql> SELECT R.route_id,R.start_location||'-'||R.end_location AS route_name,MAX(T.price)AS highest_ticket_price FROM ROUTE R JOIN SCHEDULE S ON R.route_id=S.route_id JOIN TICKET T ON S.schedule_id=T.schedule_id GROUP BY R.route_id,R.start_location,R.end_location HAVING MAX(T.price)>420;
+-----+-----+
| route_id | route_name | highest_ticket_price |
+-----+-----+
|    201 |      0 |        500.00 |
|    202 |      0 |        450.00 |
|    203 |      0 |        550.00 |
|    205 |      0 |        480.00 |
+-----+-----+
4 rows in set, 13 warnings (0.00 sec)
```

#### v. Minimum:

```
mysql> SELECT start_location,MIN(distance_km) AS shortest_route FROM ROUTE GROUP BY start_location HAVING MIN(distance_km)>300;
+-----+-----+
| start_location | shortest_route |
+-----+-----+
| chennai        |      350 |
| banglore       |      580 |
| hyderabad      |      710 |
| pune           |      450 |
+-----+-----+
4 rows in set (0.03 sec)
```

## JOIN QUERIES

## 1. LEFT JOIN

```
mysql> SELECT B.bus_id,B.model,S.schedule_id,S.dept_time FROM BUS B LEFT JOIN SCHEDULE S ON B.bus_id=S.bus_id;
+-----+-----+-----+
| bus_id | model           | schedule_id | dept_time |
+-----+-----+-----+
| 301   | volvo9700        |      401    | 2025-10-12 |
| 302   | mercedes tourismo |      402    | 2025-10-12 |
| 303   | scania touring    |      403    | 2025-10-12 |
| 304   | ashok leyland    |      404    | 2025-10-12 |
| 305   | tata starbus       |      405    | 2025-10-12 |
+-----+-----+-----+
5 rows in set (0.01 sec)
```

## 2. INNER JOIN

```
mysql> SELECT B.bus_id,B.model,D.name AS driver_name FROM BUS B INNER JOIN DRIVER D ON B.driver_id=D.driver_id;
+-----+-----+-----+
| bus_id | model           | driver_name  |
+-----+-----+-----+
| 301   | volvo9700        | rajesh kumar |
| 302   | mercedes tourismo | suresh reddy  |
| 303   | scania touring    | anil sharma  |
| 304   | ashok leyland    | vijay patel  |
| 305   | tata starbus       | karthick rao |
+-----+-----+-----+
5 rows in set (0.02 sec)
```

## 3. RIGHT JOIN

```
mysql> SELECT R.route_id,R.start_location,R.end_location,S.schedule_id FROM ROUTE R RIGHT JOIN SCHEDULE S ON R.route_id=S.route_id;
+-----+-----+-----+-----+
| route_id | start_location | end_location | schedule_id |
+-----+-----+-----+-----+
| 201     | chennai        | banglore     |      401    |
| 202     | banglore        | hyderabad    |      402    |
| 203     | hyderabad       | mumbai       |      403    |
| 204     | mumbai          | pune         |      404    |
| 205     | pune            | goa          |      405    |
+-----+-----+-----+-----+
5 rows in set (0.01 sec)
```

## 4. FULL JOIN

```
mysql> SELECT B.bus_id,B.model,S.schedule_id,S.dept_time FROM BUS B LEFT JOIN SCHEDULE S ON B.bus_id=S.bus_id UNION SELECT B.bus_id,B.model,S.schedule_id,S.dept_time FROM BUS B RIGHT JOIN SCHEDULE S ON B.bus_id=S.bus_id;
+-----+-----+-----+
| bus_id | model           | schedule_id | dept_time |
+-----+-----+-----+
| 301   | volvo9700        |      401    | 2025-10-12 |
| 302   | mercedes tourismo |      402    | 2025-10-12 |
| 303   | scania touring    |      403    | 2025-10-12 |
| 304   | ashok leyland    |      404    | 2025-10-12 |
| 305   | tata starbus       |      405    | 2025-10-12 |
+-----+-----+-----+
5 rows in set (0.19 sec)
```

## 5. NON-EQUI JOIN

```
mysql> SELECT T.ticket_id,T.passenger_name,T.price,S.dept_time FROM TICKET T JOIN SCHEDULE S ON T.price > 500 AND t.schedule_id=s.schedule_id;
+-----+-----+-----+
| ticket_id | passenger_name | price | dept_time |
+-----+-----+-----+
|      503 | jim halpert    | 550.00 | 2025-10-12 |
+-----+-----+-----+
1 row in set (0.01 sec)
```

## NESTED QUERIES

### 1. INDEPENDENT NESTED QUERY

```
mysql> SELECT D.driver_id,D.name FROM DRIVER D WHERE 20 > (SELECT COUNT(*) FROM BUS B WHERE B.driver_id=D.driver_id);
+-----+-----+
| driver_id | name      |
+-----+-----+
|     101 | rajesh kumar |
|     102 | suresh reddy |
|     103 | anil sharma |
|     104 | vijay patel |
|     105 | karthick rao |
+-----+-----+
5 rows in set (0.01 sec)
```

### 2. CORRELATED NESTED QUERIES

```
mysql> SELECT R1.route_id,R1.start_location,R1.end_location,R1.distance_km FROM ROUTE R1 WHERE R1.distance_km > (SELECT COUNT(R2.distance_km) FROM ROUTE R2 WHERE R2.start_location=R1.start_location);
+-----+-----+-----+-----+
| route_id | start_location | end_location | distance_km |
+-----+-----+-----+-----+
|    201 | chennai       | banglore     |      350 |
|    202 | banglore       | hyderabad   |      580 |
|    203 | hyderabad     | mumbai       |      710 |
|    204 | mumbai         | pune         |      150 |
|    205 | pune           | goa          |      450 |
+-----+-----+-----+-----+
5 rows in set (0.00 sec)
```

**RESULT:** Thus, to execute relational operations, SQL aggregates, join queries for bus management system is successfully executed.

## Normalization

Normalization in the context of databases refers to the process of organizing data in a database efficiently. The goal is to reduce data redundancy and dependency by organizing fields and table of a database. This helps in minimizing the anomalies that can arise when modifying the data.

There are several normal forms (NF) that define the levels of normalization, with each normal form addressing different types of issues:

### **First Normal Form (1NF):**

- Eliminate duplicate columns from the same table.
- Create a separate table for each group of related data and identify each row with a unique column or set of columns.

### **Second Normal Form (2NF):**

- Meet all the requirements of 1NF.
- Remove partial dependencies—ensure that non-prime attributes are fully functionally dependent on the primary key.

### **Boyce-Codd Normal Form (BCNF):**

- A more stringent form of 3NF.
- For a table to be in BCNF, it must satisfy an additional requirement compared to 3NF, dealing specifically with certain types of functional dependencies.

□ In this database we perform normalisation using Griffith university normalisation tool

Steps to follow for doing normalisation using Griffith normalisation process:

**Step1:** search for Griffith university normalisation tool in web browser

**Step2:** After opening the tool enter the attributes of the entity Bus\_id, Licence\_plate, Model, Capacity. Make sure to separate the attributes using commas in between them.

**Step3:** Add the dependencies of the attributes

The screenshot shows the 'Normalization Tool' interface. On the left, there's a sidebar with options: 'EDIT ATTRIBUTES' (checked), 'LOAD EXAMPLE', 'Functions' (selected), 'FIND A MINIMAL COVER', 'FIND ALL CANDIDATE KEYS', 'CHECK NORMAL FORM', 'NORMALIZE TO 2NF', 'NORMALIZE TO 3NF', and 'NORMALIZE TO BCNF'. Below that is 'About this tool'. The main area has two sections: 'Attributes in Table' with a text input containing 'Bus\_id, Licence\_Plate, Model, Capacity' and a note 'Separate attributes using a comma ( , )'; and 'Functional Dependencies' with three dependency rules: 'Model' → 'Capacity', 'Bus\_id' → 'Model', and 'Bus\_id' → 'Licence\_Plate'. Each rule has a 'Delete' button. At the bottom is a red 'Add Another Dependency' button.

Do as per your entity and add the dependencies as shown in the fig.

Step4: In the left if the window below functions on **check normal form** option

The screenshot shows the 'Normalization Tool' interface with the 'Check Normal Form' section highlighted. It displays three status indicators: a green checkmark for '2NF' (The table is in 2NF), another green checkmark for '3NF' (The table is in 3NF), and a third green checkmark for 'BCNF' (The table is in BCNF). Below these is a 'Show Steps' button with a toggle switch.

We will get the screen shown above the normal form of the given attributes is checked (BCNF)

And the following steps are displayed below:

- 📍 NORMALIZE TO 2NF
- 📍 NORMALIZE TO 3NF
- 📍 NORMALIZE TO BCNF

About this tool

## BCNF

The table is in BCNF

### Show Steps

#### 2NF

```
find all candidate keys. The candidates keys are { Bus_id }, { Licence_Plate }, The set of key attributes are: { Bus_id,Licence_Plate }
for each non-trivial FD, check whether the LHS is a proper subset of some candidate key or the RHS are not all key attributes
checking FD: Bus_id,Model -> Capacity
checking FD: Licence_Plate -> Bus_id,Model
checking FD: Bus_id -> Licence_Plate
```

#### 3NF

```
find all candidate keys. The candidates keys are { Bus_id }, { Licence_Plate }, The set of key attributes are: { Bus_id,Licence_Plate }
for each FD, check whether the LHS is superkey or the RHS are all key attributes
checking functional dependency Bus_id,Model -> Capacity
checking functional dependency Licence_Plate -> Bus_id,Model
checking functional dependency Bus_id -> Licence_Plate
```

#### BCNF

```
A table is in BCNF if and only if for every non-trivial FD, the LHS is a superkey.
```

**Result:** Thus, the normalization to 1nf,2nf,3nf, BCNF is completed successfully.

**Aim:** To implement the document database and graph database by using MongoDB.

## INPUT

```
1 db.createCollection("drivers")
2 db.createCollection("buses")
3 db.createCollection("routes")
4 db.createCollection("schedules")
5 db.createCollection("tickets")
6 db.drivers.insertMany([{"driver_id": "D001", "name": "ravi", "licence_number": "DL-01-12345"}, {"driver_id": "D002", "name": "suresh", "licence_number": "02-98765"}])
7 db.buses.insertMany([{"bus_id": "B001", "licence_plate": "KA05-AB-1234", "model": "volvo 9400", "capacity": 45, "driver_id": "D001"}, {"bus_id": "B002", "licence_plate": "KA05-XV-9988", "model": "ashok leyland", "capacity": 40, "driver_id": "D002"}])
